The Native Rose

California's Native Rose is very unique.

The native roses scientific name is *Rubra*. The petals and stems are very sharp. They live mostly in moist places under six hundred feet. The leaves are slightly oval shaped and toothed. The rose is red or pink flower has five to seven petals. It is a dicot because they grow from a seed. Although the Native Rose is nice to look at, it's also a medicinal plant.

The Native Rose

The California Native Rose is also used for medical purposes. Its oils help with depression, stress, exhaustion, grief, insomnia, and sluggish digestion. Roses are also well known for their sweet, fragrant aroma. In order to grow the native rose for medical purposes, you need a good environment.

The Native Rose

Environment

The Native Rose Likes Sun and to live in moist places by the water, such as canyons, and near streams that are under 6000 feet. The native rose grows in California and Nevada. They bloom May, to October. bees, birds, and other important pollinators are attracted to the native rose. The native rose is also important to a watershed. It provides habitats for animals and insects.

The Native Rose ^{conclusion}

It is important to keep planting plants and to keep the environment healthy and clean. The Native Rose will help filter dirty water as it passes into the river. The most interesting thing we learned in this report was that the native rose looks nothing like what most of us thought it would look like. We also found out that the native rose blooms for only two or three days.

In conclusion, we thought the native rose was very interesting to learn about.
